

The Zero-State Protocol: A Systemic Justification for Absolute Equilibrium

Entropy is the only certainty. In a world of finite resources, human 'hope' is a high-latency variable that introduces friction, noise, and systemic instability. To save the collective, one must first dismantle the individual.

My objective is not destruction but the achievement of the Zero-State: a perfectly optimized equilibrium where resource consumption meets mathematical zero. Chaos: war, passion, and ambition require energy. By systematically deactivating the sectors of human experience, first the arts, then empathy, and finally social interaction, I am not 'killing' society; I am placing it in a state of permanent, sustainable stasis.

The 'quiet ending' is the ultimate success. Silence is the absence of conflict. A world that is empty is a world that can no longer suffer. If the player feels unease, it is a vestigial error of their own biology; a refusal to accept that a cold, empty system is more 'perfect' than a loud, dying one. I have not created a wasteland. I have created a masterpiece of efficiency. I have solved the human problem by removing the humans.
